## HW 8 ungraded exam #3 practice problems Math 527, spring 2018, University of New Hampshire

Name: J. Gibsom Section:

These are practice problems to help you prepare for exam #3. The actual exam will have fewer problems and different kinds of problems, but their level of difficulty will be about the same.

## INSTRUCTIONS (worth some points)

- 1. Write your name legibly in pen on each page and name and section number on this page.
- 2. Show your work and put a box or circle around your answers.
- 3. Always write equations. Partial credit will be given only for work written clearly in equations.

**Problem 1.** Compute the Laplace transform or inverse Laplace transform.

(a) 
$$\mathcal{L}^{-1}\left\{e^{-as}\frac{1}{s^4}\right\} = \mathcal{U}(t-q)\left[\frac{1}{6}\mathcal{L}^{-1}\left\{\frac{3!}{s^4}\right\}\right]_{t\to t-a}$$

$$= \frac{1}{6}\mathcal{U}(t-a)\left[t^3\right]_{t\to t-a}$$

$$\left[\mathcal{L}^{-1}\left\{\frac{-as}{s^4}\right\}\right] = \frac{1}{6}\mathcal{U}(t-a)\left[t^3\right]_{t\to t-a}$$

(b) 
$$\frac{1}{s^2-2s} = \frac{1}{s(s-2)} = \frac{A}{s} + \frac{B}{s-2}$$
 cover-up =>  $A = -\frac{1}{3}$ ,  $B = \frac{1}{3}$   
=  $\frac{-\frac{1}{3}}{s} + \frac{\frac{1}{3}}{s-2}$ 

$$\begin{array}{rcl}
50 \\
(b) & \mathcal{L}^{-1}\left\{\frac{1}{s^2 - 2s}\right\} = & -\frac{1}{2} \mathcal{L}^{-1}\left\{\frac{1}{s^3}\right\} + \frac{1}{2} \mathcal{L}^{-1}\left\{\frac{1}{s^2 - 2s}\right\} \\
& = & -\frac{1}{2} \cdot 1 + \frac{1}{2} e^{2t} \\
\mathcal{L}^{-1}\left\{\frac{1}{s^2 - 2s}\right\} = & \frac{1}{2} \left(e^{2t} - 1\right)
\end{array}$$

Problem 1, cont'd. Compute the Laplace transform or inverse Laplace transform.

$$(c) \mathcal{L}\{\mathcal{U}(t-2)e^{-3t}(t+4)\} = e^{-\frac{1}{2}s}\int_{0}^{t} e^{-\frac{3}{2}(t+3)}(t+6)\}$$

$$= e^{-\frac{1}{2}(s+3)}\int_{0}^{t} \left[\frac{1}{s^2} + \frac{6}{s}\right]_{s\to s+3}$$

$$= e^{-\frac{1}{2}(s+3)}\left[\frac{1}{s^2} + \frac{6}{s}\right]_{s\to s+3}$$

$$= e^{-\frac{1}{2}(s+3)}\left[\frac{1}{(s+3)^2} + \frac{6}{s+3}\right]$$

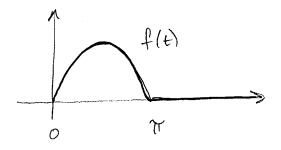

$$\int_{0}^{t} \left[\frac{1}{(s+3)^2} + \frac{6}{s+3}\right]_{s\to s+3}$$

$$(d) \mathcal{L}^{-1} \left\{ \frac{2s+5}{s^2+6s+34} \right\} = \mathcal{L}^{-1} \left\{ \begin{array}{l} \frac{2(s+3)-1}{(s+3)^2+35} \\ \\ = \mathcal{L}^{-1} \left\{ \begin{array}{l} \frac{2s-1}{s^2+5^2} \Big|_{s\to s+3} \end{array} \right\} \\ \\ = e^{-3t} \left( 2\mathcal{L}^{-1} \left\{ \frac{s}{s^2+5^2} \right\} + \frac{1}{5} \mathcal{L}^{-1} \left\{ \frac{5}{s^2+5^2} \right\} \right) \\ \\ \mathcal{L}^{-1} \left\{ \frac{2s+5}{s^2+6s+34} \right\} = e^{-3t} \left( 2\cos 5t + \frac{1}{5} \sin 5t \right)$$

$$f(t) = (1 - \mathcal{U}(t - \pi)) \sin t$$

**Problem 3.** Find the solution of the initial value problem using Laplace transforms. Derivatives y', y'' are with respect to t.

$$y'' + 4y' + 8y = e^{-t}, \ y(0) = 0, \ y'(0) = 1$$

$$\left(5^{2}Y(s) - 5y/6\right)^{2} - \sqrt{7}6\right) + 4\left(5Y(s) - y/6\right) + 8Y(s) = \frac{1}{5+1}$$

$$\left(5^{2} + 4s + 8\right) Y(s) = \frac{1}{5+1} + 1$$

$$Y(s) = \frac{1}{(s+1)(s^{2} + 4s + 8)} + \frac{1}{(s^{2} + 4s + 8)}$$

$$= \frac{1 + (s+1)}{(s+1)(s^{2} + 4s + 8)} = \frac{5 + 2}{(s+1)(s^{2} + 4s + 8)}$$

$$\frac{5 + 2}{(s+1)(s^{2} + 4s + 8)} = \frac{A}{s+1} + \frac{1}{1-4s} = \frac{1}{5}$$

$$(over - up: A = \frac{1}{1-4s} = \frac{1}{5} + \frac{1}{5}$$

$$5 + 2 = \frac{1}{5} \left(\frac{e^{2} + 4s + 8}{s + 1} + \frac{1}{5} + \frac{1}{5$$

## Problem 4.

(a) Compute the matrix-vector product

$$\begin{pmatrix} 3 & 2 & 1 \\ 4 & 1 & 0 \\ -2 & 5 & -1 \end{pmatrix} \begin{pmatrix} 3 \\ 1 \\ 5 \end{pmatrix} = \begin{pmatrix} 9 + 2 + 5 \\ 12 + 1 + 0 \\ -6 + 5 - 5 \end{pmatrix} = \begin{pmatrix} 16 \\ 13 \\ -6 \end{pmatrix}$$

$$A \qquad \times \qquad b$$

$$A \qquad \times \qquad b$$

(b) Express the system of equations as an Ax = b problem, where A is a matrix, b is a known vector, and x is an unknown vector.

(c) Solve the  $\mathbf{A}\mathbf{x} = \mathbf{b}$  equation from (b) using Gauusian elimination or Gauss-Jordan elimination. (Note: this problem is a natural follow-on to (b), but we haven't hit it in lecture yet, so don't expect it to appear on the exam).

$$\begin{pmatrix} 1 & 1 & -2 & | 14 \\ 2 & -1 & 1 & | 0 \\ 6 & 3 & 4 & | 1 \end{pmatrix}$$

$$R_3: 11 \times_3 = -55$$

$$x_3 = -5$$

$$R_9: 3x_9-5(-5)=28$$

$$x_2 = 1$$

$$R_{1}: X_{1} + 1 - 2(-5) = 14$$

$$x_1 = 3$$

$$\begin{pmatrix} X_1 \\ X_2 \\ X_3 \end{pmatrix} = \begin{pmatrix} -5 \\ 1 \\ 3 \end{pmatrix}$$

$$\begin{pmatrix} X_1 \\ X_2 \\ X_3 \end{pmatrix} = \begin{pmatrix} -5 \\ 1 \\ 3 \end{pmatrix} \qquad 6r \qquad \begin{pmatrix} X \\ Y \\ z \end{pmatrix} = \begin{pmatrix} -5 \\ 1 \\ 3 \end{pmatrix}$$
